System Setup & Operations Log

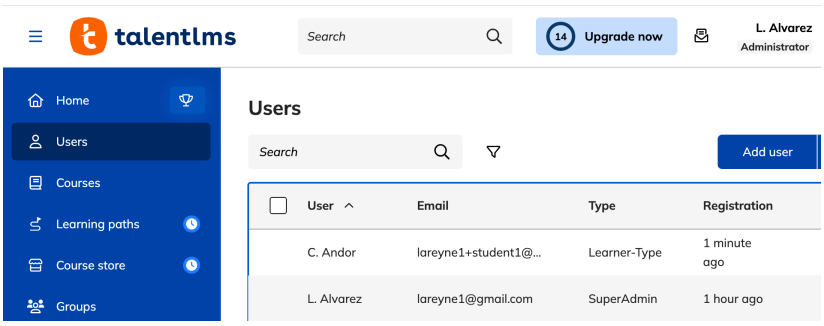

LMS Administrator: L. Alvarez
System: TalentLMS Sandbox
Organization: Ferrix University (Simulated Environment/Mock Data)

Project 0: System Setup & Portal Initialization

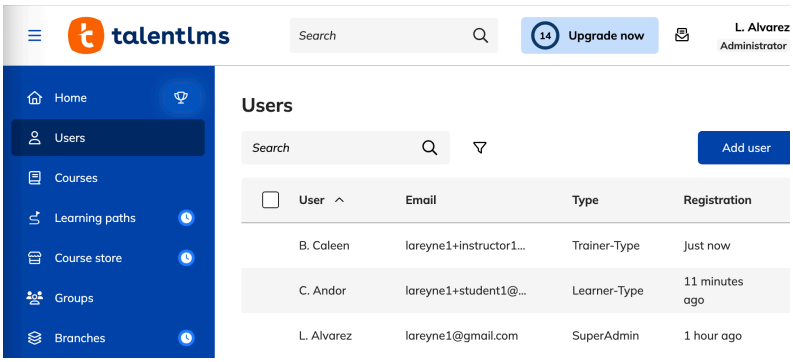

Configuration Notes:
Set up the TalentLMS portal for Ferrix University by updating the primary site name under Basic Settings. Confirmed administrator access and explored the core navigation menu.

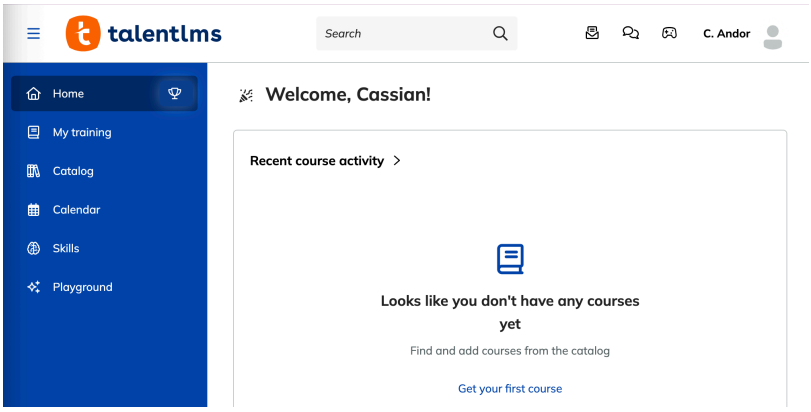

Project 1: User Management & Role-Based Access Control (RBAC)

Configuration Notes: Created a test user account for “Cassian Andor” and assigned the basic Learner role. Verified that role permissions restrict access strictly to enrolled course materials without administrative privileges.

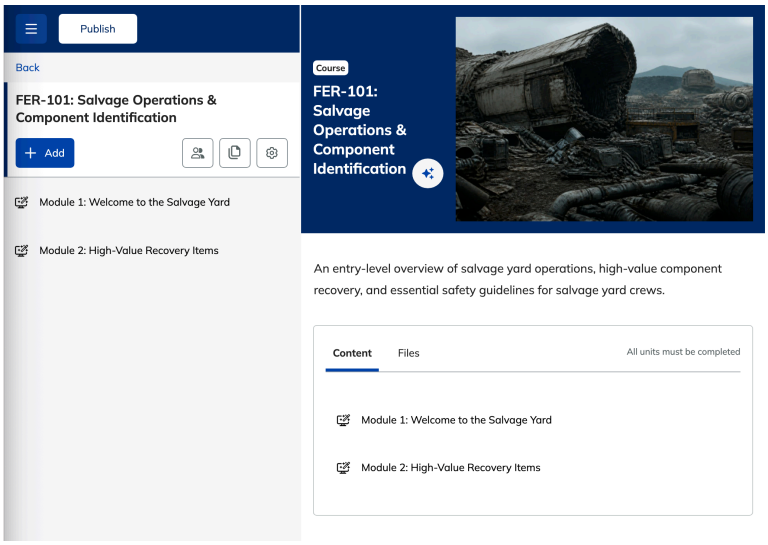

Configuration Notes: Created a secondary test user account for “Bix Caleen” and assigned the Trainer role. Verified that Trainer privileges allow course creation and management without giving access to main system administrative settings.

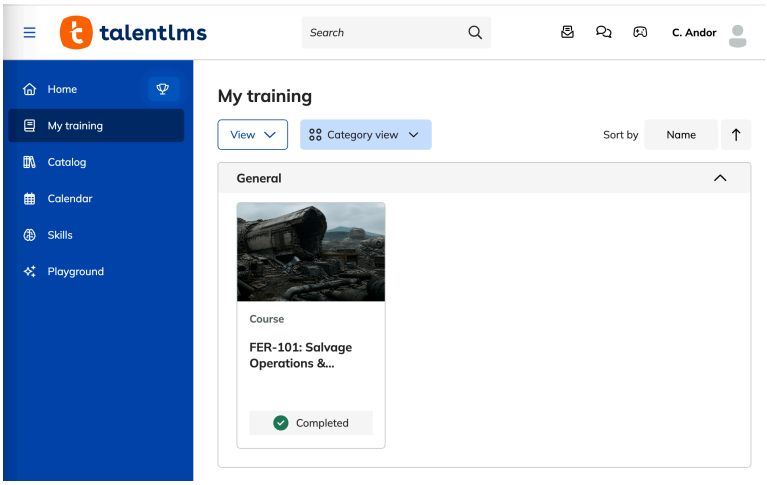

Verification & Testing Notes: Logged in directly as the test user “Cassian Andor” to perform an RBAC audit. Confirmed that Learner permissions restrict access exclusively to student-facing dashboards, ensuring all admin tools, system settings, and user management features are not accessible.

Project 2: Course Setup & Navigation

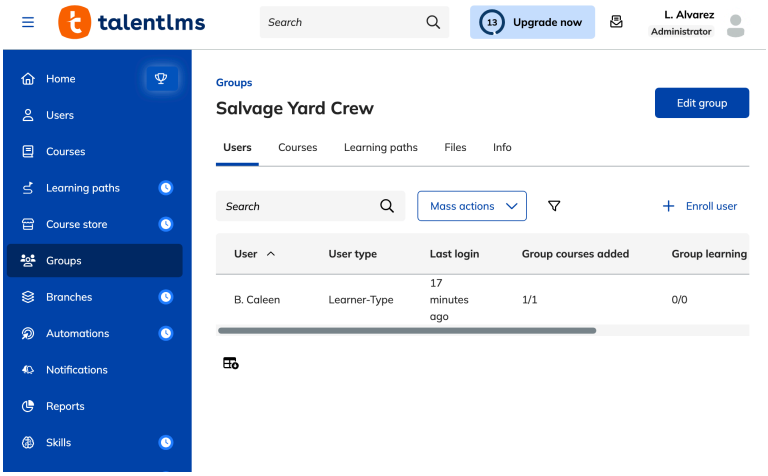

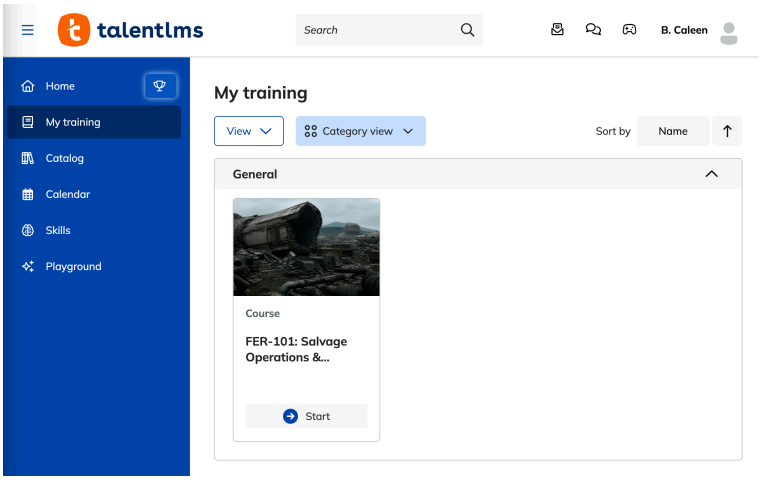

Configuration Notes: Created the course shell for “FER-101: Salvage Operations & Component Identification” with custom header branding. Built two core learning modules in TalentCraft (Module 1: Welcome to the Salvage Yard, and Module 2: High-Value Recovery Items). Configured completion rules to require 100% completion across all units before course credit is awarded.

Configuration Notes: Executed end-user testing using the “Cassian Andor” learner profile. Enrolled user, verified course availability, and successfully completed both modules. Confirmed the system automatically updated course progress and recorded a “Completed” status upon course completion.

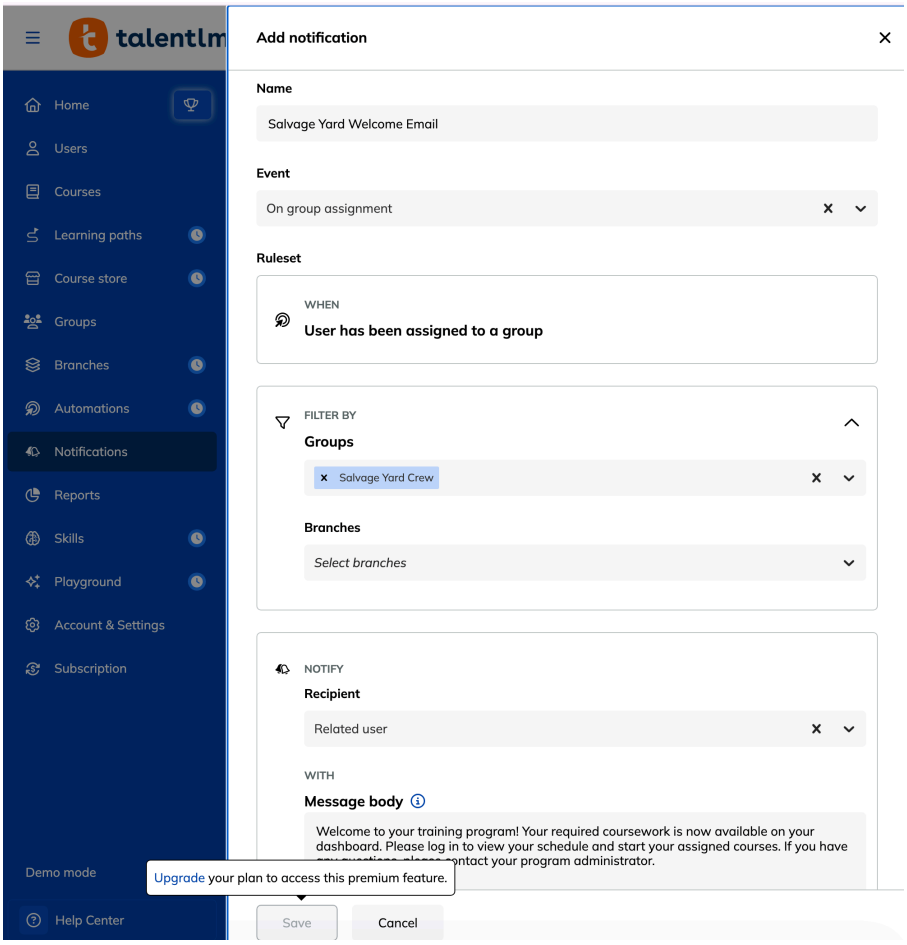

Project 3: User Enrollment & Group Automation

Configuration Notes: Configured group-based enrollment by creating the “Salvage Yard Crew” student group and attaching FER-101 course shell. Added “Bix Caleen” to the group and confirmed that the course appeared on her dashboard.

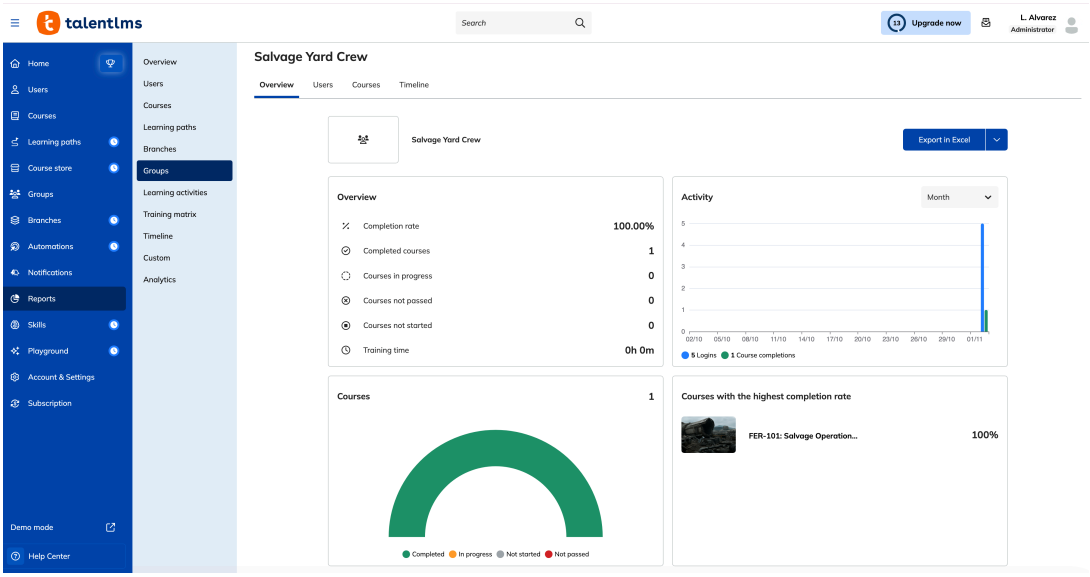

Project 4: Custom Notifications & System Triggers

Configuration Notes: Built an automated email rule to send a welcome message whenever a student is added to the “Salvage Yard Crew” group. The email gives new learners clear next steps for logging in and accessing their coursework without requiring manual admin effort.

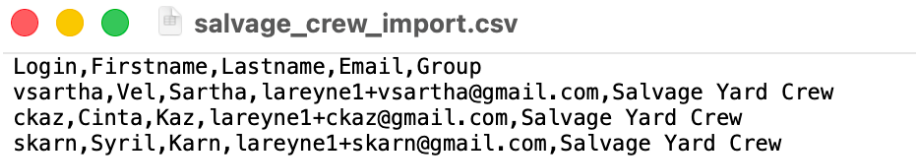

Note: Custom email triggers require a paid subscription in TalentLMS, but the system logic and setup were fully configured and verified in preview.

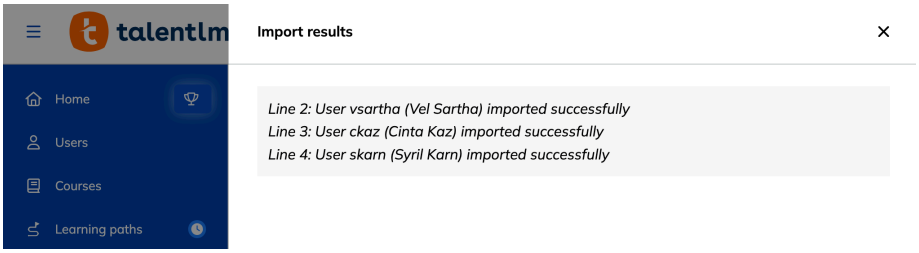

Project 5: Reports & Completion Tracking

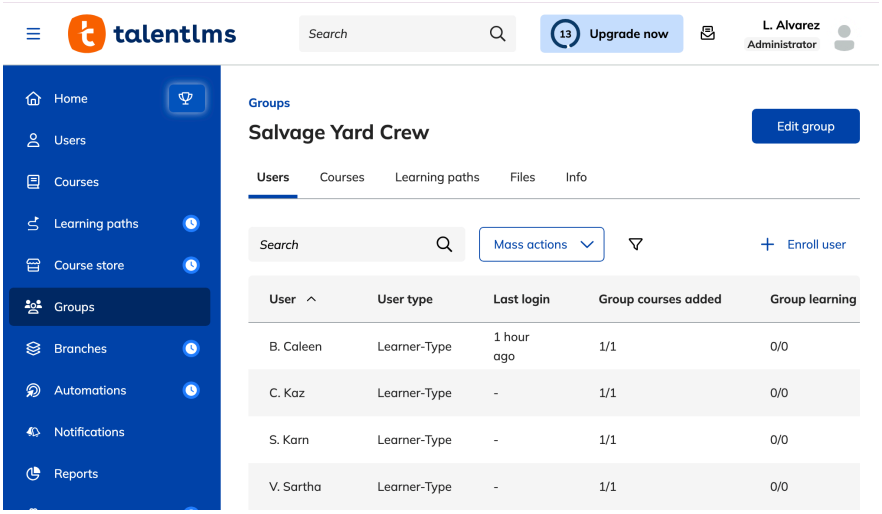

Configuration Notes: Accessed the reporting engine for the “Salvage Yard Crew” group to monitor enrollment metrics, completion rates, student activity, and total training time. Confirmed that progress data updated correctly and identified export capabilities (such as Excel reports) for ongoing administrative reporting.

Project 6: Automated User Imports & System Field Mapping

Configuration Notes: Created and uploaded a bulk CSV file to enroll multiple users into the system at once. Matched column headers to system rules so user profiles and group assignments for Salvage Yard Crew loaded cleanly. Verified that all three accounts were created successfully, and confirmed they appear directly in the active group roster.
